

Statement of purpose

I have long been aware that understanding engineering and engineering stuff is essential when trying to navigate this allegedly globalized world. Engineering is for me the opening of innovation and possibilities and crucial for further development of public health care – therefore sharing knowledge and searching new ways of understanding engineering is essential for this development. I see the importance of educating people in engineering and engineering stuff and this is also my main reason for choosing to study engineering and language in University. I have a bachelor degree in xxxxx studies and have now chosen a masters degree in xxxxxxx studies to give myself a broader perspective on how we can use engineering to solve the problems we experience in the health industry and to improve my own skills in this field.

If my studies have taught me anything, it is the importance of always improving my own skills and explore unexplored issues in the health industry. One of my goals with this exchange semester is thus to take a step back from my current point of view and attempt to push my understanding of the public health sector in Country even further. I feel that xxxxx University would be the ideal contribution to my education. This semester at the Technical University of Denmark, I have had a strict focus on theoretical and methodological frameworks relating to healthcare, innovation and technology and I have followed several courses that could be complementary to this. I would love to be able to test the applicability of different cultural approaches by studying at xxxxx and following xxx course(s). I hope that I will be able to contribute with new ideas during my classes; discuss them with fellow students of different positions than mine and gain new theoretical and methodological understandings from this academic exchange.

Following along the same line, another goal of mine is to engage with Countrys culture through fieldwork. I wish to actively participate in Xxxxx University's student environment and also to surround myself with xxxxx society as a whole. By doing so, I expect to attain more first-hand experience of xxxxx cultural practises. I remember how my undergraduate exchange at xxxxxx University really enhanced my love for exchanging engineering understandings and viewpoints on public health care in different countries. Furthermore, upon returning to Denmark, I had not only learned much more about the engineering but also acquired a better understanding of how differences in cultural background can lead to new ideas and new solutions. I now know that innovating the health care industry is a field I intent to commit to and work with in the future. I apply for this exchange spot in the hope that xxx University will help me to further evolve both academically and as a person. In exchange, I'll do my best to contribute to a productive and innovative student environment.
